Drone is now widely applied in many industries and reforming human practice significantly. To enable students to learn computational thinking through drone coding and learn the basic science knowledge of drone, they will learn the theories of how drone flies and drones programming in order to perform various missions, debug and improve their programs.

To prepare and support students to attend a competition of building robotic cars. It focuses on building the theoretical engineering knowledge and PID control application skills among youths. This program also helps them progress from mastering robotic basics and programming to AI and robot control theory. In the competition, students are required to integrate both robotic cars and drone to compete. Thus, the course will also cover basic control and knowledge of drone.

AI is really important nowadays. We hope to provide machine learning, modeling creation process for our students to experience the foundation of how AI works. We expect that students will manage to develop their own AI model after this training course and apply according to different situations; for instance, using AI to aim and follow other robot car during competition, detect visitors' mask at school entrance etc.
